EPIDEMIOLOGIC NOTES AND REPORTS

FILARIASIS - Kentucky

A case of filariasis, diagnosed in a 32-year-old male residing in Harlan, Kentucky, was reported on March 6, 1966, to the Division of Epidemiology, Kentucky State Department of Health. The patient, a native of Bihar in northeastern India, arrived in the United States in December 1965.

On the evening of March 5 the patient reported to the hospital emergency room complaining of intermittent, crampy abdominal pain since 1 p.m. that day. Bowel movements that day had been normal, and there was no nausea or vomiting. Physical examination revealed slight tenderness in the umbilical region but no other abnormal

findings. Urinalysis was normal but the white blood count was elevated with 7 percent eosinophils. The patient was given an injection which relieved the pain and he returned home.

About 2 a.m. he was awakened by severe abdominal pain and at once returned to the hospital. He seemed to be in considerable pain and appeared mildly dehydrated.

EPIDEMIOLOGIC NOTES AND REPORTS
FILARIASIS - Kentucky (Continued)

Again there were no abnormal physical findings other than some upper abdominal tenderness. However, laboratory studies showed a leucocytosis with 7 percent eosinophils on one occasion and 13 percent on a repeat examination.

The patient gave a history of having suspected filariasis 2 years ago while he was in India. Since eosinophilia was found, filariasis was suspected. Subsequently, a blood smear collected after midnight revealed microfilariae of *Wuchereria bancrofti*. The patient was started on a course of treatment with diethylcarbamazine and

showed good subjective response. Follow-up studies to demonstrate the presence or absence of the micro-filariae in the out-patient's blood are planned.

(Reported by Dr. C. Hernandez, Medical Director, Division of Epidemiology, Kentucky State Department of Health; Henry Evans, M.D., Attending Physician, Department of Medicine, Daniel Boone Clinic; and V. B. Lakhani, M.D., Resident in Medicine, Harlan Appalachian Regional Hospital, Harlan, Kentucky.)

HUMAN CASE OF ANTHRAX-Delaware

A case of anthrax was reported from Delaware on March 19, 1966. The patient is a 55-year-old male who has worked at a goat hide tanning company for 24 years. Most recently he has been employed as a trimmer of hides that have received preliminary treatment in an acid bath.

On March 2 he developed a cutaneous pustular lesion on the dorsum of his left hand. His condition was such that he was admitted to hospital on March 5; material from the lesion obtained for cultures was positive for *Bacillus anthracis*. Treatment was given with penicillin and chloramphenicol. The patient made a good recovery and was discharged from hospital on March 14.

Goat hides imported for tanning at this factory come from Jamaica, India, Nigeria, Ethiopia, Iran and Pakistan. Since 1936 there have been 10 cases of cutaneous anthrax

reported among employees of the factory. The most recent case prior to the current case occurred in 1962. This patient, also a 55-year-old male, assisted in unpacking raw hides imported from India in barrels and put them in vats preliminary to a "soaking" operation; he subsequently developed a lesion on the right forearm. Vaccination with the anthrax cell-free vaccine for employees who work in the high risk areas of the plant is now being considered by the company officials.

(Reported by Dr. E. F. Gliwa, Deputy State Health Officer, Delaware State Board of Health; Dr. Joseph M. Barsky, Jr., Attending Physician, Wilmington, Delaware; and Investigations Section of Epidemiology Branch, CDC.)

SULFONAMIDE-RESISTANT MENINGOCOCCAL INFECTION - Batesville, Arkansas

A fatal case of confirmed meningococcal meningitis in a 5-month-old child who lived in Batesville, Arkansas, has been reported from Little Rock, Arkansas. The onset of illness was March 21, 1966. On March 25 the child's sister, who had been given a sulfonamide drug for prophylaxis, developed meningococcal meningitis. Culture of her spinal fluid yielded group B meningococci which were later shown to be sulfonamide-resistant. The patient responded well to penicillin therapy and has made a complete recovery.

(Reported by Dr. J. T. Herron, State Health Officer, Arkansas State Health Officer; and an EIS Officer, CDC.)

Editorial Note:

This report illustrates one of the rarely occurring secondary family cases of meningococcal meningitis and emphasizes the problem of sulfonamide prophylaxis when the infecting strain of meningococcus is resistant to sulfonamide drugs. Although penicillin is the agent of choice in therapy, its usefulness as a prophylactic agent is controversial and has not been critically evaluated. Penicillin does not eradicate meningococci from the nasopharynx even when given orally as penicillin V at a dose of 4,800,000 units daily.

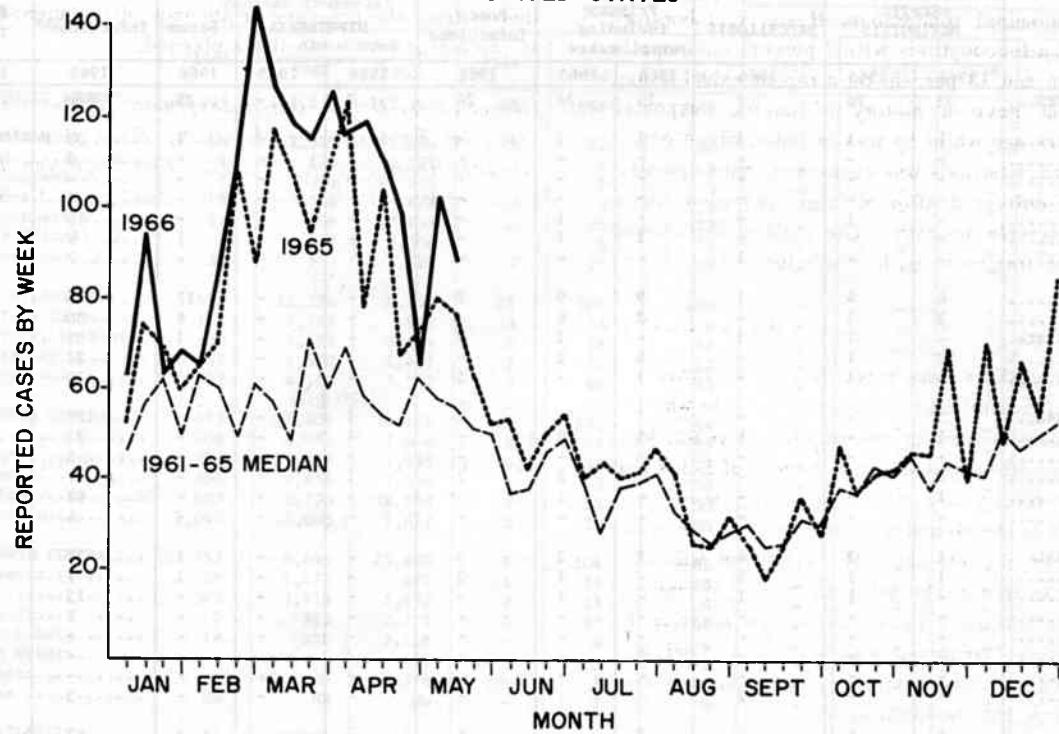

**CURRENT TRENDS
 MENINGOCOCCAL INFECTIONS**

For the week ended May 14, 1966, 88 cases of meningococcal infection, of which 5 cases are in military personnel and 83 cases in civilians, have been reported to the Communicable Disease Center. The cumulative total for the first 19 weeks of this year is 1,886, an increase of 17.1 percent over the 1,611 cases reported

during the comparable period in 1965. Figure 1 shows the weekly number of cases reported through the 19th week of 1966. The anticipated downward trend has not yet become established.

(Reported by the Investigations Section, Epidemiology Branch, CDC.)

Union of Soviet Socialist Republics

On p. 57 and p. 65, add:

Smallpox vaccination certificate required for all travellers from the United Kingdom on arrival in the USSR.

THE MORBIDITY AND MORTALITY WEEKLY REPORT, WITH A CIRCULATION OF 15,600, IS PUBLISHED AT THE COMMUNICABLE DISEASE CENTER, ATLANTA, GEORGIA.

CHIEF, COMMUNICABLE DISEASE CENTER
CHIEF, EPIDEMIOLOGY BRANCH
ACTING CHIEF, STATISTICS SECTION

DAVID J. SENCER, M.D.
A.D. LANGMUIR, M.D.
IDA L. SHERMAN, M.S.

EDITOR: MMWR

D. J. M. MACKENZIE, M.B.
F.R.C.P.E.

IN ADDITION TO THE ESTABLISHED PROCEDURES FOR REPORTING MORBIDITY AND MORTALITY, THE COMMUNICABLE DISEASE CENTER WELCOMES ACCOUNTS OF INTERESTING OUTBREAKS OR CASE INVESTIGATIONS WHICH ARE OF CURRENT INTEREST TO HEALTH OFFICIALS AND WHICH ARE DIRECTLY RELATED TO THE CONTROL OF COMMUNICABLE DISEASES. SUCH COMMUNICATIONS SHOULD BE ADDRESSED TO:

THE EDITOR
MORBIDITY AND MORTALITY WEEKLY REPORT
COMMUNICABLE DISEASE CENTER
ATLANTA, GEORGIA 30333

NOTE: THE DATA IN THIS REPORT ARE PROVISIONAL AND ARE BASED ON WEEKLY TELEGRAMS TO THE CDC BY THE INDIVIDUAL STATE HEALTH DEPARTMENTS. THE REPORTING WEEK CONCLUDES ON SATURDAY; COMPILED DATA ON A NATIONAL BASIS ARE RELEASED ON THE SUCCEEDING FRIDAY.

CHOLERA VACCINATION

Because of the possibility of the spread of cholera westward from Asia and the Middle East to countries in Eastern Europe, all travellers to these areas are advised to be vaccinated against cholera and have in their possession a valid international certificate of vaccination or revaccination against cholera.

The standard primary course of cholera vaccine recommended is two injections given at least 7 days apart. For persons vaccinated previously one booster dose of vaccine is recommended for revaccination.

The cholera vaccination certificate is valid for 6 months beginning 6 days after the first injection in the primary series. If revaccination is within the 6-month period the certificate then issued is valid immediately. If the revaccination is done after the 6-month period of the previous certificate has expired, the subsequent certificate does not become valid until 6 days after revaccination.

Cholera vaccination may be carried out by private physicians who can issue certificates on the international form. These certificates are not valid, however, until they bear the approved stamp of the local, County or State Health Authority. Failure to observe this requirement will cause the traveller inconvenience.

The USSR requires valid cholera vaccination certificates from all arrivals from Turkey.

Lebanon requires all travellers from Asia to be in possession of valid cholera vaccination certificates.
